How drugs affect drivers*

In general, drugs have the following effects on drivers.

• Slower reaction times
• Poor concentration
• Sleepiness and fatigue
• Confused thinking
• Distorted perception (not seeing things as they really appear)
• Reduced co-ordination
• Erratic behaviour
• Nausea
• Hallucinations
• Blurred vision and enlarged pupils
• Aggression
• Panic attacks and paranoia
• Tremors
• Dizziness
• Cramps

These tests can be used as evidence of driver impairment in a prosecution for drug driving. Where a person is arrested on suspicion of drug driving the Gardaí have the power to require the person to provide a blood specimen.

Penalties
If you are convicted of drug driving, you will get:
• a minimum 1-year driving disqualification if you are found to be above the legal threshold for cocaine, cannabis or heroin (since April 2017);
• a minimum of 4 years driving disqualification if you are found to have drugs in your body and are impaired to such an extent that you do not have proper control of a vehicle;
• up to €5,000 fine;
• up to 6 months in prison;
• a criminal record.

Medicines and driving
If you are taking prescription or over-the-counter medicines under the advice of your doctor or pharmacist, and so long as those medicines don’t impair your driving, you have nothing to be concerned about. If you are in any doubt, you should speak to your doctor or pharmacist about your concerns.

A statutory medical exemption certificate is provided for in the law for people who have been prescribed medicinal cannabinoids in Ireland (medicinal marijuana). If this applies to you, you should carry the medical certificate with you while driving.

Driving Under the Influence of Illicit Drugs and/or the Abuse of Prescription Drugs

The use of any illicit drug or the abuse of prescription drugs makes it highly unsafe for anyone – whether a driver, cyclist or pedestrian – to use the road.

Driving under the influence of drugs has been an offence in Ireland since 1961. The law states that a person must not be impaired (through alcohol, drugs or any combination of both) while driving or in charge of a vehicle.

New offence
An additional offence, introduced in April 2017, provides that a person cannot drive while over specified limits of 3 specified drugs (Cannabis, Cocaine and Heroin).

Puts you and others in danger
Drug driving not only puts the driver at risk but also passengers and others who share the road. Even a small amount of certain drugs can seriously affect a driver’s motor skills, balance and co-ordination, perception, attention, reaction time, and judgment on the roads.

Driving under the influence of drugs remains a significant problem in Ireland. The Medical Bureau of Road Safety (MBRS) has found that almost two-thirds of the 9,734 specimens of blood and urine tested between the years 2009 and 2015 tested positive for the presence of a drug or drugs.

A review of road traffic collisions and drug and alcohol toxicology analyses from the Coroner’s District in Kildare from 1998 to 2009 found that almost one in ten drivers killed had a positive result for one or more drugs.

Cannabis and benzodiazepines (Valium-like drugs – tranquillisers typically used to treat anxiety) are currently the most common drugs found in drivers driving under the influence of drugs, followed by opiates, cocaine and methadone.

Contributes to bad decision-making
Many drug drivers incorrectly believe that certain drugs make them better drivers and imagine themselves at low risk of collision. They also tend to overestimate their driving ability and show little understanding of how drugs affect their driving. Many have poor awareness of the impairing effects of drugs and make bad decisions about driving as a result.

Drugs and their effects on driving
- **Cannabis**
- **Cocaine**
- **Heroin (and other opiates like Morphine)**
- **Benzodiazepines (Valium)**

Cannabis reduces the ability to perform complex driving tasks like merging traffic, crossing junctions and so on.

Cocaine increases risk taking – for example speeding, turning in front of other vehicles, inattentive driving, and poor impulse control.

Heroin (and other opiates like Morphine) impair the mental and physical abilities needed to drive a car. Effects include slow driving, weaving, poor vehicle control, poor co-ordination and falling asleep at the wheel.

Benzodiazepines (Valium) reduce reaction times, the ability to perform multiple tasks and memory. They also increase the effects of fatigue. However, unplanned withdrawal can also cause problems, and withdrawal from benzodiazepines should only be undertaken with your doctor’s advice and supervision.

Drug driving and the law
Firstly, it is against the law to drive under the influence of drugs (including prescribed drugs) where your driving is impaired to such an extent that you don’t have proper control of the vehicle.

Secondly, it is against the law to drive under the influence of certain drugs (regardless of driving performance) above specified levels. There are currently 3 drugs specified – cannabis, cocaine and heroin. If you are found to have any of these drugs above the specified limits, you can be prosecuted for drug driving with no proof of impairment necessary (as is currently the case for alcohol limits).

New ‘preliminary’ drug test
In April 2017, the Gardaí can conduct ‘Preliminary Drug Testing’ at Mandatory Intoxication Testing Checkpoints where they can now test for alcohol and/or drugs). This will allow the Gardaí to establish checkpoints for testing drivers for drugs with similar powers to existing alcohol testing checkpoints. This system will allow Gardaí to test a driver’s oral fluid for cannabis, cocaine, opiates (for example, heroin, morphine) and benzodiazepines (for example, Valium).

Gardaí can also conduct impairment tests to assess whether a driver’s ability to drive is impaired.

As part of this test, drivers must do five impairment tests:
- a pupil dilation test,
- modified Romberg balance test,
- walk and turn test,
- one-leg stand, and
- a finger-to-nose test.
