OVERVIEW

registered

registered

vehicles."

vehicles was 185.

The 1995 rate

Introduction

collisions.

was 346 per Much progress has been made in reducing the number of fatalities and serious injuries on our national roads. In 2005, the fatality rate per million registered million of vehicles was 185. The 1995 rate was 346 per million registered vehicles. However, much remains to be done.

> In 2005, of the 27,807 Garda-reported motor vehicle traffic collisions, 396 people were killed, 9,318 people were injured, and 21,274 collisions involved property or material damage only.

> The fatality rate per 100,000 population was 9.6 in 2005, an increase of 0.3 percentage points from the 2004 rate of 9.3.

> The estimated cost of all fatal and injury road collisions reported to and recorded by An Garda Síochána in 2005 was €1.44 billion.

> This report covers all road traffic collisions reported to the Garda Síochána, where details have been recorded and forwarded to the Road Safety Authority, involving fatalities, personal injury or material damage which occurred on public roads in Ireland (exclusive of Northern Ireland) in 2005. Collisions on private property, such as railway station approaches or private lanes, are excluded.

> We also examine trends in collisions, fatalities and injuries over time, in both past decade as well as the most recent trends in various cross sections of road traffic and transport systems.

Page No.

"In 2005, the Motor vehicle travel is a primary means of transportation, providing a high fatality rate per degree of mobility. For all its advantages, fatalities and injuries resulting from *million of* motor vehicle collisions are unacceptable. The mission of the Road Safety Authority is to reduce fatalities, injuries and economic losses from motor vehicle

Cars

"26 percent of were not usina seat belt."

In 2005, 222 car occupants were killed in collisions accounting for 56 percent of car drivers killed all fatalities and an additional 6406 were injured. Sixty-five percent of car *in traffic crashes* occupants killed were drivers and 23 percent were front seat passengers. Most of **in 2005** the car drivers killed were male (72%).

> Twenty-six percent of car drivers and 10 percent of front seat car passengers involved in fatal collisions were not using seat belt.

Motorcycles

"Per vehicle kilometres travelled. motorcyclists were 26 times more likely than car users to be killed."

The 56 motorcyclist fatalities that occurred in 2005 accounted for 14 percent of all fatalities. An additional 535 motorcyclists were injured.

Per vehicle kilometres travelled in 2001, motorcyclists were 26 times more likely than car users to be killed and 4 times more likely than pedalcyclists to be killed.

Pedalcycles

In 2005, 10 pedalcyclists were killed and additional 223 were injured in collisions. Pedalcyclists made up 2 percent of all fatalities. Most of the pedalcyclists killed or injured were male (80% and 70% respectively). In 2005, 60 percent (6) of all the pedal cycle traffic fatalities reported involved goods vehicles.

Pedestrians

In 2005, 74 pedestrians were killed. Twenty-seven percent of the pedestrian killed were aged 65 and over.

Figure A2. Car Drivers Fatalities by Age and Sex, 2005

Primary Collision Type

Thirty percent of all fatal collisions in 2005 were single vehicle only collisions. This represents a decrease of six percentage points over the 2004 situation.

This collision type, which involves no other road user, is most probably associated with a number of causal factors, including excessive speed, fatigue and / or alcohol consumption. Single vehicle only collisions accounted for just 19 per cent of injury collisions.

Head-on collisions accounted for 28 per cent of fatal collisions and 17 per cent of injury collisions. Collisions involving pedestrians accounted for 18 per cent of all fatal collisions and 13 per cent of all injury collisions.

Single vehicle, head-on and pedestrian collisions all accounted for a greater percentage of fatal than injury collisions, indicating that these collision types are, on average, more severe than angle, rear-end or 'other' road collision types, which together accounted for 47 percent of injury collisions but only 24 per cent of fatal collisions.

ROAD ACCIDENT FACTS IRELAND 2005

"In 2005, three out of five of all the pedal cycle fatalities resulted from collisions involving a goods vehicle."

Date and Time

The worst month for fatalities in 2005 was October when 44 people died in 38 collisions.

April and June recorded the fewest number of collisions (20), of which 23 and 22 persons died respectively.

The number of fatal collisions between the hours of 9.00 pm and 3.00 am, the hours most strongly associated with drinking and driving, was 92 in 2005, with 100 persons being killed in these collisions. This period accounted for 26 percent of fatal collisions and 25 percent of fatalities in 2005.

The number of persons killed during the later hours of darkness (between 3.00 am and 6.00 am), was 54, this increased by 18 over the 2004 level. Fatalities that occurred during these hours accounted for approximately 14 percent of all road collision fatalities in 2005.

The worst days of the week for fatalities during 2005 were Saturdays and Sundays. These two days together accounted for 177 fatalities, or 45 percent of the total. The days of the week with fewest associated fatalities were Tuesday and Wednesday, on which days 67 people, or 17 percent of the total, died.

Location

Twenty-seven percent of all fatal collisions in 2005 occurred on urban roads, a decrease of three percentage points over the 2004 figure. The percentage of fatal collisions occurring on rural roads increased by three percentage points to 73 per cent. However, the percentage of all fatal collisions occurred on national roads remained the same compared to the 2004 figure (40%).

On a county-by-county basis, Cavan experienced the highest number of collisions per population (3.3 per 1,000 persons) as well as per 1,000 registered vehicles (5.7). Waterford experienced the highest number of collisions per 10 million Vehicle Kilometres of Travel (2.7).

Notes and Definitions

All Road Collisions

By 'all reported road collisions' is meant all collisions investigated by or brought to the notice of the Garda Síochána where the exact location of the collision can be determined.

Collisions and Casualties

Road collisions are classified as fatal, personal injury or material damage; casualties are classified as either killed or injured.

Fatal Collision:

Where at least one person is killed as a result of the collision and death occurs within 30 days.

Serious Injury Collision:

Where there are no deaths, but a person or persons are seriously injured.

The definition of "serious injury" is an injury for which the person is detained in hospital as an 'in-patient', or any of the following injuries whether or not detained in hospital: fractures, concussion, internal injuries, crushings, severe cuts and lacerations, severe general shock requiring medical treatment.

Minor Injury Collision:

Where there are no deaths or serious injuries. The definition of a "minor injury" is: an injury of a minor character such as a sprain or bruise.

Material Damage Collision:

Where no deaths or injuries occur but damage is caused to a vehicle or property.

Learner Driver

A learner driver is a driver holding a provisional licence.

Vehicles

Vehicles are classified as follows -

1. Pedal Cycle

A pedal cycle is a two or three-wheeled road vehicle fitted with pedals deriving its sole means of propulsion from human power.

2. Motor Cycle

A motor cycle is any mechanically propelled twowheeled machine and includes mopeds and motor scooters.

3. Car

A passenger road motor vehicle, other than a motor cycle, seating not more than eight passengers (excluding the driver).

4. Public Service Vehicle (P.S.V.)

A passenger road motor vehicle having seating accommodation for more than eight passengers (excluding the driver), and used for the carriage of passengers for reward.

5. Goods Vehicle

A road motor vehicle designed, exclusively or primarily, to carry goods.

6 Other Motor Vehicle

Other motor vehicles are miscellaneous types of motor vehicle not falling into any of the main categories (e.g. Agricultural Tractor).

Rural Area

A rural area $\,$ is defined as an area where the speed limit zone was greater than 60 k.p.h $\,$ in 2005.

Urban Area

An urban area is defined as an area where the speed limit zone was less than or equal to 60 k.m/h in 2005.

Built-up Area

A built-up area means an area which was within a 50 to 60 km/h. speed limit zone in 2005.

Dark

By 'dark' is meant the hours of darkness which begin half an hour after sunset and end half an hour before sunrise.

Section 1: Trends in Road Traffic Collisions

We examine trends in collisions, fatalities and injuries over time, in both past decade as well as the most recent trends in various cross sections of road traffic and transport systems.

1.1. Road Fatalities

A total of 396 people were killed in 360 collisions on Irish roads in 2005. This represents an increase of 22 fatalities (or six percent) on 2004. The trend of the number of road fatalities in the period 1995-2005 is shown in Figure 1. The number of fatalities decreased (in the period 1997-1999). This downward trend

Figure 1: Annual Number of Road Fatalities, 1995-2005

became less pronounced in the period 1999-2001. After that, the downward trend was maintained until 2003. The reduction in fatalities reversed after 2003. The lower figure noted for 2003 may have been influenced by the introduction of the penalty points system on 31st October, 2002.

"In 2005, there were 27,807 Garda-reported traffic collisions, in which 396 people were killed and 9,318 people were injured; 21,274 collisions involved property or material damage only."

1.2. Trends in Fatalities by Transport Mode

The annual number of fatalities by road transport mode in the period 1995-2005 is given in Figure 2. The number of car user fatalities increased over the period 1995-2000. After that, car user fatalities decreased sharply until 2003. In the period 2004-2005, the number of car user fatalities increased from 208 to 222.

There was a downward trend in the number of pedestrian fatalities in the period 1997-2003. However, the number of pedestrian fatalities increased in the period 2003-2005. A downward trend has been maintained in pedal cyclist fatalities, while an upward trend has been maintained by motorcyclist fatalities in the period 1998-2005. The trend for other road users fatalities (PSV users, goods vehicle users and miscellaneous types of motor vehicles) was sporadic.

Figure 2: Number of Fatalities by Transport Mode, 1995-2005

1.3. Trends in Fatalities by Road Types

Seventy-seven percent (306) of all the fatalities occurred on two-way single carriageways. Over the period 2000-2005 there has been a downward trend in fatalities on dual carriageways and an upward trend on one-way single carriageways.

Figure 2b: Number of Fatal Collisions by Road Type, 2000-2005

Figure 3: Number of Injury Collisions, 1973-2005*

* Trends seen in 1995 and 2001 may have been influenced by alterations to the collision recording

1.4 Trends in Injury Collisions

Figures 3 and 4 show the time trend in injury and serious injury collisions. There is a downward trend in the number of serious injury collisions since 1995. The number of injury collisions (serious and minor combined) was increasing up until 1995. After that, the number of injury collisions reversed, and a downward trend has been maintained.

1.5 Material Damage Collisions

The number of material damage collisions (where no injuries or fatalities are sustained but material damage is caused to vehicle and / or property) both reported to and recorded by An Garda Síochána increased from 16,525 in 2004 to 21,274, in 2005.

1.6 Road User Category

Compared to 2004 there was a substantial increase in the number of car user fatalities (which rose from 208 to 222) and a decrease in pedal cyclist fatalities (which declined from 11 to 10). However, the number of pedestrian fatalities increased (which rose from 70 to 74), while the number of motorcyclist fatalities increased by six to 56. The number of other road users (PSV users, goods vehicle users and miscellaneous types of motor vehicles) killed remained almost the same.

ROAD ACCIDENT FACTS IRELAND 2005

Figure 5: Motor Cyclists and Pedal Cyclists Killed, percentage of total, 1973-2005

Figure 6: Pedestrians and Car Users Killed, percentage of total, 1973-2005

1.7 Primary Collision Type

Thirty percent of all fatal collisions in 2005 were single vehicle only collisions. This represents a decrease of six percentage points over the 2004 situation. This collision type, which involves no other road user, is strongly associated with two causal factors, namely excessive speed and / or alcohol consumption. Single vehicle only collisions accounted for just 19 per cent of injury collisions.

Head-on collisions accounted for 28 per cent of fatal collisions and 17 per cent of injury collisions. Collisions involving pedestrians accounted for 18 per cent of all fatal collisions and 13 per cent of all injury collisions.

Single vehicle, head-on and pedestrian collisions all accounted for a greater percentage of fatal than injury collisions, indicating that these collision types are, on average, more severe than angle, rear-end or 'other' road collision types, which together accounted for 47 percent of injury collisions but only 24 per cent of fatal collisions.

6

1.8 Contributory Factors to Road Collisions

The contributory factors listed by members of An Garda Síochána on collision report forms changed little from 2003 (see Table 17 on page 20). Driver error accounted for 90 percent of all contributory factors identified, while the next most-listed factor, pedestrian error, accounted for 7 percent. Road Factors accounted for 1.2 per cent of all listed contributory factors, while the figures for vehicle and environmental factors were 0.6 and 1.2 per cent respectively.

In two vehicle only fatal collisions - see Figure 9 - the most frequently cited contributory factor is 'went to the wrong side of the road' (44%), followed in turn by 'exceeded safe speed limit' (22 percent), 'other action' (18 percent), 'drove through stop / yield' (11 percent) and 'improper overtaking' (4 percent).

1.9 Collision Costs

Based on the costs outlined in the 2004 Goodbody Economic Consultants report entitled 'Cost Benefit Parameters and Application Rules for Transport Project Appraisal', the estimated cost of all fatal and injury road collisions reported to and recorded by An Garda Síochána in 2005 is €1.44 billion.

1.10 International Comparisons

On the basis of road deaths per 100,000 population, Ireland's rate at 9.3 in 2004, the latest year for which international comparative information is available, ranks eighth out of the EU-15 (excluding former accession countries).

Figure 10: European Union Fatality Rate per 100,000 Population, 2004*

Section 2: Date and Time

2.1 The Month of the Year

The worst month for fatalities in 2005 was October when 44 people died in 38 collisions. April and June recorded the fewest number of collisions (20), of which 23 and 22 people died respectively.

> Figure 11: Percentage of Persons Killed and Injured Classified by Hour of Day

2.2 Persons Killed or Injured by Hour of Day

Figure 11 gives the percentage of fatalities and injuries by hour of the day. The highest number of fatalities occurred between the hours of 16:00 and 18:00, the hours most probably associated with fatigue, since this is the time most people leave work for home.

The number of fatal collisions between the hours of 9.00 pm and 3.00 am, the hours most strongly associated with drinking and driving, was 92 in 2005, with 100 people being killed in these collisions. This period accounted for 26 percent of fatal collisions and 25 percent of fatalities in 2005.

The number of people killed during the later hours of darkness (between 3.00 am and 6.00 am) was 54, i.e. an increase of 18 over the 2004 level. Fatalities that occurred during these hours accounted for approximately 14 percent of all road collision fatalities in 2005.

2.3 Fatalities by Days of the Week

The worst days of the week for fatalities during 2005 were Saturdays and Sundays. These two days together accounted for 177 fatalities, or 45 percent of the total. The days of the week with fewest associated fatalities were Tuesday and Wednesday, on which days 67 people, or 17 percent of the total, died.

Section 3: Location

3.1 Trends in Fatal Collisions by Rural, Urban and National Route

Twenty-seven percent of all fatal collisions in 2005 occurred on urban roads, a decrease of three percentage points over the 2004 figure. The percentage of fatal collisions occurring on rural roads increased by three percentage points to 73 percent. Forty percent of all fatal collisions occurred on national roads, a decrease of two percentage points on the 2003 figure.

Figure 13: Percentage of Fatal Accidents in Rural, Urban Areas and on the National Routes, 1995-2005.

3.2 On a County-by-County Basis

Collision rate per thousand population in 2002, per thousand registered vehicles in 2005 and per 10 million vehicle-kilometres of travel 2001, for each county are given in Table A. On a county-by-county basis, Cavan experienced the highest number of collisions per population (3.3 per 1,000 persons) as well as per 1,000 registered vehicles (5.7). Waterford experienced the highest number of collisions per 10 million Vehicle Kilometres of Travel (2.7).

Table A: Collision Rates per Thousand Population (2002), per Thousand Registered Vehicles (2005), and per 10 Million Vehicle-Kilometres of Travel (2001), for each County

County	No. of Collisions per 1,000 Population ¹	No. of Collisions per 1,000 Registered Vehicles ²	No. of Collisions per 10 Million Vehicle Kilometres of Travel

1) Most countries adopt the 30-day definition of death due to a road accident. In cases where the 30-day rule is not used, a correction factor was applied to the figures to ensure comparability between countries.
